Voltage Transducer DVM 4200  

\[ U_{PN} = 4200 \text{ V} \]

For the electronic measurement of voltage: DC, AC, pulsed..., with galvanic separation between the primary and the secondary circuit.

### Features
- Bipolar and insulated measurement up to 6000 V
- Current output
- Input and output connections with M5 studs
- Compatible with LV 100 family
- Built-in device.

### Advantages
- Low consumption and low losses
- Compact design
- Very low sensitivity to common mode voltage variations
- Excellent accuracy (offset, sensitivity, linearity)
- Fast response time
- Low temperature drift
- High immunity to external interferences.

### Applications
- AC variable speed and servo motor drives
- Static converters for DC motor drives
- Battery supplied applications
- Uninterruptible Power Supplies (UPS)
- Switched Mode Power Supplies (SMPS)
- Power supplies for welding applications
- Renewable Energy (Solar and Wind).
- Single or three phase inverters
- Propulsion and braking choppers
- Propulsion converters
- Auxiliary converters
- High power drives
- Substations.

### Standards
- EN 50155: 2007
- EN 50121-3-2: 2016
- EN 50124-1: 2017
- IEC 62497-1: 2010
- IEC 61010-1: 2010
- IEC 62477-1: 2012
- UL 347 1): 2016
  1) When used with UL 347 Isolator N° 92.24.06.420.0.

### Application Domain
- Industrial and Railway (fixed installations and onboard).
Safety

⚠ Caution

If the device is used in a way that is not specified by the manufacturer, the protection provided by the device may be compromised. Always inspect the electronics unit and connecting cable before using this product and do not use it if damaged. Mounting assembly shall guarantee the maximum primary conductor temperature, fulfill clearance and creepage distance, minimize electric coupling, and unless otherwise specified can be mounted in any orientation.

⚠ Caution, risk of electrical shock

This transducer must be used in limited-energy secondary circuits SELV according to IEC 61010-1, in electric/electronic equipment with respect to applicable standards and safety requirements in accordance with the manufacturer’s operating specifications.

Use caution during installation and use of this product; certain parts of the module can carry hazardous voltages and high currents (e.g. power supply, primary conductor). Ignoring this warning can lead to injury and/or cause serious damage.

De-energize all circuits and hazardous live parts before installing the product. All installations, maintenance, servicing operations and use must be carried out by trained and qualified personnel practicing applicable safety precautions.

This transducer is a built-in device, whose hazardous live parts must be inaccessible after installation. This transducer must be mounted in a suitable end-enclosure. Always wear protective clothing and gloves if hazardous live parts are present in the installation where the measurement is carried out.

Main supply must be able to be disconnected. Never connect or disconnect the external power supply while the primary circuit is connected to live parts. Never connect the output to any equipment with a common mode voltage to earth greater than 30 V. Make sure to have a distance of minimum 30 mm between the transducer primary terminals and other neighboring components.

This transducer is a built-in device, not intended to be cleaned with any product. Nevertheless if the user must implement cleaning or washing process, validation of the cleaning program has to be done by himself.

Impact rating IK06 according to IEC 62262.

⚠ ESD susceptibility

The product is susceptible to be damaged from an ESD event and the personnel should be grounded when handling it.

Do not dispose of this product as unsorted municipal waste. Contact a qualified recycler for disposal.

Underwriters Laboratory Inc. recognized component

Absolute maximum ratings apply at 25 °C unless otherwise noted.
Stresses above these ratings may cause permanent damage.
Exposure to absolute maximum ratings for extended periods may degrade reliability.

### UL 347: Ratings and assumptions of certification

File # E315896 Volume: 1 Section: 3

#### Standards
- CSA C22.2 No. 253 Medium-Voltage AC Contactors, Controllers, and Control Centers
- UL 347 Standards for Safety for Medium-Voltage AC Contactors, Controllers, and Control Centers.

#### Conditions of acceptability

When installed in the end-use equipment, consideration shall be given to the following:

1. These devices must be mounted in a suitable end-use enclosure.
2. The terminals have not been evaluated for field wiring.
3. The rated Basic Insulation Level (BIL) is 20 kV for this device, after performing Impulse Withstand Tests. Additional testing will be required if a higher BIL rating is desired.
4. For products rated more than 2500 V, the specific kit model “UL 347 isolator” shall be mounted to the DVM.
5. The products have been evaluated for a maximum surrounding air temperature of 85 °C.
6. Low voltage circuits are intended to be powered by a circuit derived from an isolating source (such as a transformer, optical isolator, limiting impedance or electro-mechanical relay) and having no direct connection back to the primary circuit (other than through the grounding means).

#### Marking

Only those products bearing the UL or UR Mark should be considered to be Listed or Recognized and covered under UL’s Follow-Up Service. Always look for the Mark on the product.

Assembly of UL 347 Isolator on primary studs.

UL 347 Isolator, reference number 92.24.06.420.0, to be ordered separately.

Typical performance characteristics

**Figure 1:** Maximum measuring resistance

$$R_{\text{max}} = \min \left( \frac{84 - (T_A - 25) \cdot 10^3}{U_p}, \frac{1000 \cdot 10^3}{U_p} - 25 \right) \Omega$$

**Figure 2:** Supply current function of supply voltage

**Figure 3:** Supply current function of temperature

**Figure 4:** Total error in temperature

**Figure 5:** Electrical offset thermal drift

LEM reserves the right to carry out modifications on its transducers, in order to improve them, without prior notice.
**Typical performance characteristics**

Figure 6: Sensitivity thermal drift

Figure 7: Typical linearity error at 25 °C

Figure 8: Typical output noise voltage spectral density $u_{no}$ referred to secondary with $R_M = 50 \Omega$

Figure 9: Typical total output RMS noise current $I_{no}$ referred to secondary with $R_M = 50 \Omega$

Figure 8 (output noise voltage spectral density) shows that there are no significant discrete frequencies in the output. Figure 9 confirms the absence of steps in the total output RMS noise current that would indicate discrete frequencies.

To calculate the total output RMS noise in a frequency band $f_1$ to $f_2$, the formula is:

$$I_{no}(f_1 \text{ to } f_2) = \sqrt{I_{no}(f_2)^2 - I_{no}(f_1)^2}$$

Example:

What is the total output RMS noise from 100 to 1 kHz?

Figure 9 gives $I_{no}$(100 Hz) = 1.0 µA and $I_{no}$(1 kHz) = 3.13 µA.

$$\sqrt{(3.13 \times 10^{-9})^2 - (1.0 \times 10^{-9})^2} = 2.97 \mu A$$

Therefore, the total output RMS noise current is 2.97 µA.

Figure 13: Phase shift function of frequency
Simplified transducer model

The static model of the transducer with current output at temperature $T_A$ is:

$$I_S = S \cdot U_P \cdot (1 + \varepsilon)$$

In which (referred to primary):

$U_P$ : primary voltage (V)

$U_{P_{\text{max}}}$ : maximum primary voltage applied to the transducer (V)

$I_S$ : secondary current (A)

$S$ : sensitivity of the transducer

$TCS$ : temperature coefficient of $S$

$T_A$ : ambient operating temperature (°C)

$U_{OE}$ : electrical offset voltage (V)

$\varepsilon_{IT}$ : Temperature variation of $\varepsilon_S$

$\varepsilon_{L} (U_{P_{\text{max}}})$ : linearity error for $U_{P_{\text{max}}}$

This model is valid for primary voltage $U_P$ between $-U_{P_{\text{max}}}$ and $+U_{P_{\text{max}}}$ only.

This is the absolute maximum error. As all errors are independent, a more realistic way to calculate the error would be to use the following formula:

$$\varepsilon = \sqrt{\sum_{i=1}^{N} \varepsilon_i^2}$$

Total error referred to primary

The total error $\varepsilon_{\text{tot}}$ is the error at $\pm U_{P_{\text{N}}}$ relative to the rated value $U_{P_{\text{N}}}$.

It includes all errors mentioned above

- the electrical offset $U_{OE}$
- the sensitivity error $\varepsilon_S$
- the linearity error $\varepsilon_L$ (to $U_{P_{\text{N}}}$).

Electrical offset referred to primary

Using the voltage cycle shown in previous figure, the electrical offset voltage $U_{OE}$ is the residual output referred to primary when the input voltage is zero.

$$U_{OE} = \frac{U_P (3) + U_P (5)}{2}$$

The temperature variation $U_{OT}$ of the electrical offset voltage $U_{OE}$ is the variation of the electrical offset from 25 °C to the considered temperature.

$$U_{OT} (T) = U_{OE} (T) - U_{OE} (25°C)$$

Sensitivity and linearity

To measure sensitivity and linearity, the primary voltage (DC) is cycled from 0 to $U_P$, then to $-U_P$ and back to 0 (equally spaced $U_{P_{\text{N}}}/10$ steps). The sensitivity $S$ is defined as the slope of the linear regression line for a cycle between $\pm U_{P_{\text{N}}}$.

The linearity error $\varepsilon_L$ is the maximum positive or negative difference between the measured points and the linear regression line, expressed in % of $U_{P_{\text{N}}}$.

Figure 15: Voltage cycle used to measure the electrical offset (transducer supplied)
Terms and definitions

Definition of typical, minimum and maximum values

Minimum and maximum values for specified limiting and safety conditions have to be understood as such as well as values shown in “typical” graphs.

On the other hand, measured values are part of a statistical distribution that can be specified by an interval with upper and lower limits and a probability for measured values to lie within this interval.

Unless otherwise stated (e.g. “100 % tested”), the LEM definition for such intervals designated with “min” and “max” is that the probability for values of samples to lie in this interval is 99.73 %.

For a normal (Gaussian) distribution, this corresponds to an interval between −3 sigma and +3 sigma. If “typical” values are not obviously mean or average values, those values are defined to delimit intervals with a probability of 68.27 %, corresponding to an interval between −sigma and +sigma for a normal distribution.

Typical, maximal and minimal values are determined during the initial characterization of the product.

Delay times

The delay time $t_{D\%10}$ @ 10 % and the delay time $t_{D\%90}$ @ 90 % with respect to the primary are shown in the next figure. Both slightly depend on the primary current $di/dt$.

They are measured at nominal current.

![Figure 16: delay time $t_{D\%10}$ @ 10 % and delay time $t_{D\%90}$ @ 90 %](image-url)
**Mechanical characteristics**

- General tolerance: ±1 mm
- Transducer fastening: 2 holes Ø 6.5 mm, 2 M6 steel screws
  - Recommended fastening torque: 5 N·m ±10 %
- Connection of primary: 2 M5 threaded studs
  - Recommended fastening torque: 2.2 N·m ±10 %
- Connection of secondary: 3 M5 threaded studs
  - Recommended fastening torque: 2.2 N·m ±10 %

**Remarks**

- $I_p$ is positive when $U_{HV+} - U_{HV-} > 0$ V.
- The transducer is directly connected to the primary voltage.
- The primary cables have to be routed together all the way.
- The secondary cables also have to be routed together all the way.
- Installation of the transducer is to be done without primary or secondary voltage present

**Installation of the transducer**

Installation of the transducer must be done unless otherwise specified on the datasheet, according to LEM Transducer Generic Mounting Rules. This application note is available on LEM website.
