

For the electronic measurement of current: DC, AC, pulsed..., with galvanic separation between the primary and the secondary circuit.

Features

- Closed loop multi-range current transducer
- Voltage output
- Unipolar supply voltage
- Compact design for PCB mounting.

Special feature

- Primary conductors with 5 turns.

Advantages

- Very low offset drift
- Very good di/dt immunity
- Reference pin with two modes: Ref IN and Ref OUT
- Extended measuring range for unipolar measurement.

Applications

- AC variable speed and servo motor drives
- Static converters for DC motor drives
- Battery supplied applications
- Uninterruptible Power Supplies (UPS)
- Switched Mode Power Supplies (SMPS)
- Power supplies for welding applications
- Solar inverters.

Standards

- IEC 61800-5-1: 2007
- IEC 62109-1: 2010
- IEC 62477-1: 2012
- UL 508:2013.

Application Domain

- Industrial.

Absolute maximum ratings

Parameter	Symbol	Unit	Value
Maximum supply voltage	$U_{C \max}$	V	7
Maximum primary conductor temperature	$T_{B \max}$	°C	110
Maximum primary current	$I_{P \max}$	A	$20 \times I_{PN}$
Electrostatic discharge voltage (HBM - Human Body Model)	$U_{ESD \text{ HBM}}$	kV	4

Stresses above these ratings may cause permanent damage. Exposure to absolute maximum ratings for extended periods may degrade reliability.

UL 508: Ratings and assumptions of certification

File # E189713 Volume: 2 Section: 11

Standards

- CSA C22.2 NO. 14-10 INDUSTRIAL CONTROL EQUIPMENT - Date 2011/08/01
- UL 508 STANDARD FOR INDUSTRIAL CONTROL EQUIPMENT - Date 2013

Ratings

Parameter	Symbol	Unit	Value
Primary involved potential		V AC/DC	600
Max surrounding air temperature	T_A	°C	105
Primary current	I_P	A	According to series primary currents
Secondary supply voltage	U_C	V DC	7
Output voltage	U_{out}	V	0 ... 5

Conditions of acceptability

When installed in the end-use equipment, consideration shall be given to the following:

- 1 - *These devices must be mounted in a suitable end-use enclosure.*
- 2 - *The terminals have not been evaluated for field wiring.*
- 3 - *The LES, LESR, LKSR, LPSR, LXS and LXSR Series shall be used in a pollution degree 2 environment or better.*
- 4 - *Low voltage circuits are intended to be powered by a circuit derived from an isolating source (such as a transformer, optical isolator, limiting impedance or electro-mechanical relay) and having no direct connection back to the primary circuit (other than through the grounding means).*
- 5 - *These devices are intended to be mounted on the printed wiring board of the end-use equipment (with a minimum CTI of 100).*
- 6 - *LES, LESR, LKSR and LPSR Series: based on results of temperature tests, in the end-use application, a maximum of 110 °C cannot be exceeded on the primary jumper.*

Marking

Only those products bearing the UL or UR Mark should be considered to be Listed or Recognized and covered under UL's Follow-Up Service. Always look for the Mark on the product.

Insulation coordination

Parameter	Symbol	Unit	Value	Comment
RMS voltage for AC insulation test, 50 Hz, 1 min	U_d	kV	2	
Impulse withstand voltage 1.2/50 μ s	U_{Ni}	kV	6	
Insulation resistance	R_{INS}	G Ω	18	measured at 500 V DC
Partial discharge RMS test voltage ($q_m < 10$ pC)	U_t	kV	1.65	
Clearance (pri. - sec.)	d_{Cl}	mm	7.55	See dimensions drawing on page 13
Creepage distance (pri. - sec.)	d_{Cp}			
Case material	-	-	V0	According to UL 94
Comparative tracking index	CTI		600	
Application example System voltage		V	300	Reinforced insulation, non uniform field according to IEC 61800-5-1, CAT III, PD2
Application example System voltage		V	600	Basic insulation, non uniform field according to IEC 61800-5-1, CAT III, PD2

Definition of typical, minimum and maximum values

Minimum and maximum values for specified limiting and safety conditions have to be understood as such as well as values shown in “typical” graphs.

On the other hand, measured values are part of a statistical distribution that can be specified by an interval with upper and lower limits and a probability for measured values to lie within this interval.

Unless otherwise stated (e.g. “100 % tested”), the LEM definition for such intervals designated with “min” and “max” is that the probability for values of samples to lie in this interval is 99.73 %.

For a normal (Gaussian) distribution, this corresponds to an interval between -3 sigma and $+3$ sigma. If “typical” values are not obviously mean or average values, those values are defined to delimit intervals with a probability of 68.27 %, corresponding to an interval between $-\text{sigma}$ and $+\text{sigma}$ for a normal distribution.

Typical, maximal and minimal values are determined during the initial characterization of the product.

Typical performance characteristics LKSR 6-NP/SP1

Figure 3: Delay time

Figure 4: Noise voltage spectral density

Figure 5: du/dt

Maximum continuous DC primary current

Figure 6: I_p vs T_A for LKSR 6-NP/SP1

The maximum continuous DC primary current plot shows the boundary of the area for which all the following conditions are true:

- $I_p < I_{PM}$
- Junction temperature $T_J < 125$ °C
- Primary conductor temperature < 110 °C
- Max power dissipation of internal resistors $< 0.5 \times$ resistors nominal power.

Frequency derating

Figure 7: Maximum RMS AC primary current / maximum DC primary current vs frequency

Performance parameters definition

Ampere-turns and amperes

The transducer is sensitive to the primary current linkage θ_p (also called ampere-turns).

$$\theta_p = N_p \cdot I_p \text{ (At)}$$

Where N_p is the number of primary turn (depending on the connection of the primary jumpers)

Caution: As most applications will use the transducer with only one single primary turn ($N_p = 1$), much of this datasheet is written in terms of primary current instead of current linkages. However, the ampere-turns (At) unit is used to emphasis that current linkages are intended and applicable.

Simplified transducer model

The static model of the transducer at temperature T_A is:

$$U_{out} = S \cdot \theta_p + \varepsilon$$

In which $\varepsilon =$

$$U_{OE} + U_{OT}(T_A) + \varepsilon_s \cdot \theta_p \cdot S + \varepsilon_L(\theta_{Pmax}) \cdot \theta_{Pmax} \cdot S + TCS \cdot (T_A - 25) \cdot \theta_p \cdot S$$

- With:
- $\theta_p = N_p \cdot I_p$: primary current linkage (At)
 - θ_{Pmax} : max primary current linkage applied to the transducer
 - U_{out} : Output voltage (V)
 - T_A : ambient operating temperature (°C)
 - U_{OE} : electrical offset voltage (V)
 - $U_{OT}(T_A)$: temperature variation of U_O at temperature T_A (°C)
 - S : sensitivity of the transducer (V/At)
 - TCS : temperature coefficient of S
 - ε_s : sensitivity error
 - $\varepsilon_L(\theta_{Pmax})$: linearity error for θ_{Pmax}

This model is valid for primary ampere-turns θ_p between $-\theta_{Pmax}$ and $+\theta_{Pmax}$ only.

Total error

The total error at 25 °C ε_{tot} is the error in the $-I_{PN} \dots +I_{PN}$ range, relative to the rated value I_{PN} .

It includes:

- the electrical offset U_{OE}
- the sensitivity error ε_s
- the linearity error ε_L (to I_{PN})

Electrical offset

The electrical offset voltage U_{OE} can either be measured when the ferro-magnetic parts of the transducer are:

- Completely demagnetized, which is difficult to realize, or
- in a known magnetization state, like in the current cycle shown in figure 9.

Using the current cycle shown in figure 9, the electrical offset is:

$$U_{OE} = \frac{U_{out}(t_1) + U_{out}(t_2)}{2}$$

The temperature variation U_{OT} of the electrical offset voltage U_{OE} is the variation of the electrical offset from 25 °C to the considered temperature:

$$U_{OT}(T) = U_{OE}(T) - U_{OE}(25 \text{ °C})$$

Note: the transducer has to be demagnetized prior to the application of the current cycle (for example with a demagnetization tunnel).

Figure 8: Test connection

Magnetic offset

The magnetic offset current I_{OM} is the consequence of a current on the primary side ("memory effect" of the transducer's ferromagnetic parts). It is measured using the following primary current cycle. I_{OM} depends on the current value I_{P1} ($I_{P1} > I_{PM}$).

$$I_{OM} = \frac{U_{out}(t_1) - U_{out}(t_2)}{2} \cdot \frac{1}{S_N}$$

Figure 9: Current cycle used to measure magnetic and electrical offset (transducer supplied)

Performance parameters definition

Sensitivity and linearity

To measure sensitivity and linearity, the primary current (DC) is cycled from 0 to I_p , then to $-I_p$ and back to 0 (equally spaced $I_p/10$ steps). The sensitivity S is defined as the slope of the linear regression line for a cycle between $\pm I_{PN}$.

The linearity error ϵ_L is the maximum positive or negative difference between the measured points and the linear regression line, expressed in % of I_{PN} .

Delay times

The delay time $t_{D,10}$ @ 10 % and the delay time $t_{D,90}$ @ 90 % are shown in figure 10.

Both depend on the primary current di/dt . They are measured at nominal ampere-turns.

Figure 10: $t_{D,10}$ (delay time @ 10 %) and $t_{D,90}$ (delay time @ 90 %)

Application information

Filtering and decoupling

Supply voltage U_C

The transducer has internal decoupling capacitors, but in the case of a power supply with high impedance, it is highly recommended to provide local decoupling (100 nF or more, located close to the transducer) as it may reduce disturbance on transducer output U_{out} and reference U_{ref} due to high varying primary current. The transducer power supply rejection ratio is low at high frequency.

Output U_{out}

The output U_{out} has a very low output impedance of typically 1 Ohm; it can drive capacitive loads of up to 100 nF directly. Adding series resistance R_f of several tenths of Ohms allows much larger capacitive loads C_f (higher than 1 μ F). Empirical evaluation may be necessary to obtain optimum results. The minimum load resistance on U_{out} is 1 kOhm.

Total Primary Resistance

The primary resistance is 0.72 m Ω per conductor.

In the following table, examples of primary resistance according to the number of primary turns.

Number of primary turns	Primary Nominal RMS current	Output voltage U_{out}	Primary resistance R_P [m Ω]	Recommended connections
1	$\pm I_{PN}$	$U_{ref} \pm 0.625$	0.14	
2	$\pm I_{PN}/2$	$U_{ref} \pm 0.625$	1.32	
3	$\pm I_{PN}/3$	$U_{ref} \pm 0.625$	2.16	
4	$\pm I_{PN}/4$	$U_{ref} \pm 0.625$	2.52	
5	$\pm I_{PN}/5$	$U_{ref} \pm 0.625$	3.6	

Reference U_{ref}

Like the output U_{out} , the U_{ref} has a very low output impedance of typically 1 Ohm; it can drive capacitive loads of up to 100 nF directly. Adding series resistance R_f of several tenths of Ohms allows much larger capacitive loads C_f (higher than 1 μ F). Empirical evaluation may be necessary to obtain optimum results. The minimum load resistance on U_{ref} is 10 kOhms.

Figure 11: Filtered U_{out} connection

External reference voltage

The REF pin can be used either as a reference voltage output or as a reference voltage input. When used in reference voltage output, the internal reference voltage U_{ref} is used by the transducer as the reference point for bipolar measurements.

The internal reference voltage output accuracy is defined in the electrical parameter data.

When used in reference voltage input, an external reference voltage is connected to the REF pin.

In this case, the maximum allowable reference voltage range is 0.5 V - 2.75 V.

The REF pin must be able to source or sink an input current of 1.5 mA maximum.

If the reference voltage is not used, the REF pin should be left unconnected.

The following graphs show how the measuring range of each transducer version depends on the external reference voltage value U_{ref} .

Figure 12: Measuring range versus external U_{ref} LKSR 6 A

Upper limit: $I_p = -9.6 * U_{ref} + 45.6$ ($U_{ref} = 0.5 \dots 2.75$ V)

Lower limit: $I_p = -9.6 * U_{ref} + 2.4$ ($U_{ref} = 0.5 \dots 2.75$ V)

Example with $U_{ref} = 1.65$ V:

- The 6 A version has a measuring range from -13.44 A to +29.76 A

Example with $U_{ref} = 0.5$ V:

- The 6 A version has a measuring range from -2.4 A to +40.8 A

Dimensions (in mm)

Mechanical characteristic

- General tolerance ± 0.25 mm

Remark

- Installation of the transducer must be done, unless otherwise specified on the datasheet, according to LEM Transducer Generic Mounting Rules. Please refer to LEM document N° ANE120504 available on our Web site: <https://www.lem.com/en/file/3137/download/>.

Packaging information

Standard delivery in cardboard: L × W × H: 315 × 200 × 120 mm

Each cardboard contains 200 parts, placed into 4 Polystyrene-made trays of 50 parts each one.

Both trays and cardboard are ESD-compliant.

The typical weight of the cardboard is 2.5 Kg.

IMPORTANT NOTICE
